CLIENT PROFILE

ISMC is a 2500 TCD Sugar Plant near Chadchan and Havinal village, Taluka Indi, District Bijapur, Karnataka.

The project is implemented at a cost of Rs. 91.08 crore. The molasses generation is 4% of the cane crushed i.e. 100t/day (0.01 MTPA) Bagasse generated from the Sugar Plant is 750 t/day.

COMPANIES EXPECTATIONS from our Web based ERP software

Background: Put the project in prospective, briefly and very generally, explain the environment and challenges in terms of

- Country and region
- Economic environment
- Regulatory environment
- IT Readiness of the region.

Project Goals: The higher keys of the organization should get On-Line up to the minute information about their business. So that decision making will be powerful and cost effective.

The system should be integrated through financial, CRM, supply chain management operations.

OUR IMPLEMENTATION

Effects and achievement

Most of the things were manual and it was a delighted experience while working with the above company. The major problem was there with their purchase billing cycle. As per their suggestion they told us that in any organization during the heavy competition to the purchase price are going high and selling price are coming down. So to put us in such atmosphere we need to have very controlled and cost effective purchase module which definitely will be affect the other operations in the organization.

Their issues were regarding,

1. Purchase cane billing,
2. Cultivator wise billing.
3. Transporter wise billing. Village distance fixed distance wise.
4. Harvester field road wise billing.
5. Cast (village & fixed distance) wise billing
6. Deduction in all, Factory advance, Security Deposit Deduction, Pani-Patti deduction, bank loan deduction.

Because all above work has been done every fourth nightly and it was very tedious and complicated job in manual system.

As our experts overcome all the above problems and streamline it regularly.

Other experience in the training process, which we individually concentrate as per their work and focuses and put our expertise from different vertical like finance, productions, CRM, supply chain, store and inventory and so on.

success

“Enterprise mashups across legacy Intranet, databases, and financial applications have resulted in a 25 percent productivity gain across all our departments, saving us millions of dollars!”

TECHNOLOGY USED

For our IBS suit we use oracle 10g as a backend and oracle application forms as a front end. It is a 3-tire architecture system. It required minimum hardware and minimum system software. It works even a Linux operating system and since it is a Web based, no expenses occur hi-fi connectivity. It works and any authorized user can access it form any point of contact with even simple data core.

REGULATOR ENVIRONMENT

As we are having Remote service facility, at any point of contact we solve the problems on line. We are having dedicated expertise working for that only. Ill comment from the user and owner of ISMC.

Users: with the VGIPL software our working efficiency has set double. It is very user friendly software and their on line remote services are very fast and quick problem resolving expertise.

Owner: before VGIPL software, I never get the specific MIS (Graphical) reports to take the financial decision. But not with this software every thing are crystal clear and I am free from breakdown, employee problems and other day-to-day issues.
